

A thick, supportable frozen crust on E, S and W aspects creates a stable snowpack for now.

Avalanche activity will be confined to new snow that falls on top of this crust.

Near Cooke City we found a generally stable snowpack, similar to the rest of the advisory area. For the next few days avalanches will be confined to new snow that falls. These slides can be dry or wet loose slides, or fresh wind slabs. Carefully assess the stability of the new snow before riding steep terrain. Photo: GNFAC
