Skier triggered hard wind slab at Bridger

Date Sun, 11/27/2022 - 14:15 Activity Skiing

Skier triggered wind slab avalanche around 2pm, along the edge of north Bowl and Bronco near "The John". Crown 6-10" deep and 30 feet wide, hard slab of recent drifted snow. HS-ASc-D1.5. Strong wind blowing steady from the south-southwest and transporting snow, filling in tracks rapidly.

Immediately after this <u>slide</u>, I saw what I assume was skier triggered, <u>slide</u> of similar size a little further down the bowl with crown drifting in. Beacon check of debris produced no signal, barely deep enough to bury someone.

Region Bridger Range Location (from list) Bridger Bowl
