

Lots of New Snow in Hyalite (lot more than Snotel)

Date

Sat, 03/25/2023 - 12:00

Activity

Skiing

Toured into Moser Creek on 3/25 to find some pow turns. Measured 85cm ~34" of new snow and saw many shooting cracks on a density change in the new snow but surprisingly no propagating pit test results. It seemed that the snow was so new and so low density that it wasn't making a cohesive slab. There was a stark new to old snow interface.

Region

Northern Gallatin

Location (from list)

Lick Creek

Observer Name

Harrison Bigos-Lowe
